

How to improve national energy statistics

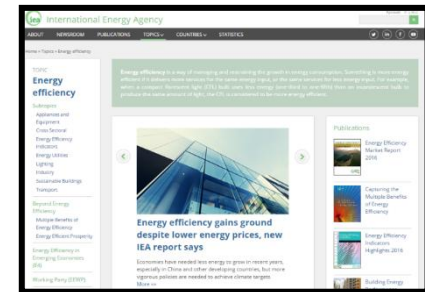

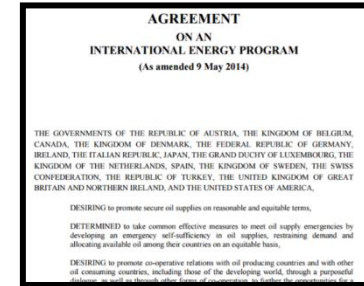

Loïc Coënt

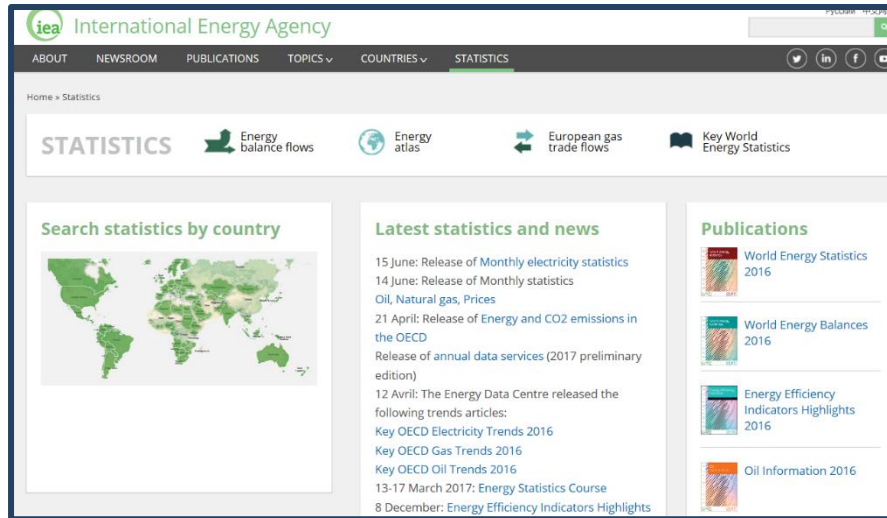

IEA Energy Data Centre

Rome, Cluster Francophone – L'inventaire des émissions de GES,
28 August 2017

- Intergovernmental organization founded in 1974, in response to oil disruptions
- Mission: to ensure reliable, affordable and clean energy for its members and beyond
- Autonomous Agency of the OECD
29 Members; 2 Accession;
6 Association countries
- Worldwide engagement

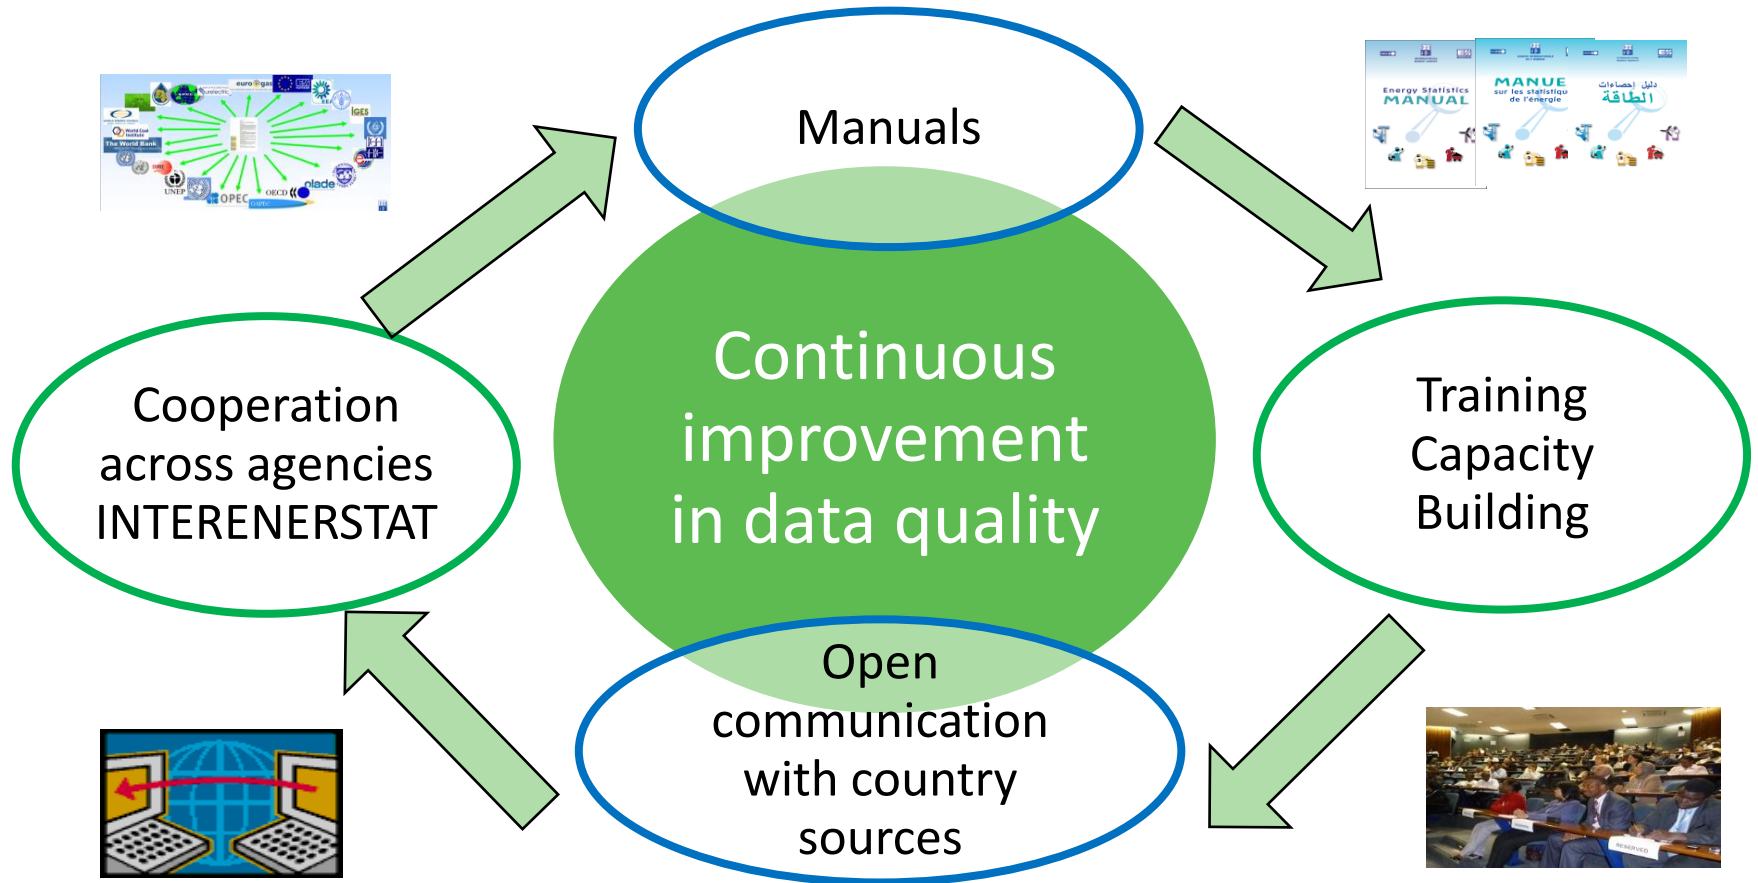

The screenshot shows the IEA Statistics website interface. At the top, there is a navigation bar with links for ABOUT, NEWSROOM, PUBLICATIONS, TOPICS, COUNTRIES, and STATISTICS. Below the navigation bar, there are four main categories: Energy balance flows, Energy atlas, European gas trade flows, and Key World Energy Statistics. The main content area is divided into three columns: 'Search statistics by country' with a world map, 'Latest statistics and news' with a list of recent releases and articles, and 'Publications' with a list of reports including 'World Energy Statistics 2016', 'World Energy Balances 2016', 'Energy Efficiency Indicators Highlights 2016', and 'Oil Information 2016'.

- To develop comprehensive global energy statistics and enhance their dissemination to inform energy policy
- To improve countries ability to produce energy stats, through training and cooperation, with a particular emphasis on association countries
- To raise the profile of statistics and statisticians and highlight the relevance to policy making

How does the IEA strengthen energy statistics quality globally?

International cooperation is key: global harmonization work

The screenshot shows the United Nations Statistics Division website. The main content area is titled "International Recommendations for Energy Statistics" and includes the text: "The United Nations Statistical Commission, at its forty-second session held in New York, 22 to 25 February 2011, adopted the *International Recommendations for Energy Statistics (IRES)*." Below this text is a "White cover publication (English)" image of the IRES report cover. The cover features the title "International Recommendations for Energy Statistics" and various energy-related icons. To the left of the main content is a sidebar with a list of links under the heading "Energy Statistics".

International Recommendations on Energy Statistics (IRES)

- Elaborated through very wide consultation (Oslo City Group and InterEnerStat): IEA leading harmonisation effort across partners
- Adopted by the UN Statistical Commission in 2011

Examples of IEA energy statistics manuals and available guidance

Background	Country	Austria		R/Su/O1
	Organisation	Statistics Austria		
Data collection	Name of the survey	Household energy consumption survey		
	Survey purpose	<ul style="list-style-type: none"> To determine total household energy consumption To determine household appliances energy consumption To collect household energy expenditure To collect dwelling physical characteristics To collect household occupant characteristics 		
	Sample design	Stratified random sampling approach		
	Sample sources	List of addresses, list of telephone numbers, labour force survey.		
Notes and comments	Collection methods	<ul style="list-style-type: none"> Computer assisted personal interview (CAPI) Computer assisted telephone interview (CATI) 		
	Sample/Population size	14 000 / 3 429 720	Response rate	55%
	Frequency	Every two years	Last time surveyed	2010
	Time to complete survey	10 minutes	Mandatory	No
	Incentive	None		
	Survey respondents	Households		
Other documentation	Elements collected	Dwelling type, dwelling floor area, building age, household occupancy, energy-related renovations, household energy consumption and related expenditures.		
	End-uses collected	Space cooling, space heating, domestic hot water, other: cooking.		
Notes and comments	Main challenges	<ul style="list-style-type: none"> Inconsistent responses Response quality 		
	Possible improvements			
	Key best practice	<p>A new approach to data control compared with previous surveys was taken for the first time in 2004 and continued in the follow-up survey runs. Up to and including the 2000 survey, only the individual energy sources themselves were checked for plausibility, any missing data were calculated (quantity-value pairs) and substitutions were made if necessary. Such routines of course continue to be used, with the additional step that the total of the reported energy consumption is then related to a calculated (fictitious) overall consumption. This fictitious overall consumption by the household is calculated from the data for that household, on the one hand (floor space, number of people in household) and pre-set parameters for the individual types of use (space heating, water heating, cooking, other purposes), on the other hand. Calculating the total reported energy consumption per household in this way involves some quite complicated plausibility routines, because one or more alternative quantities have to be calculated if the quantity-value pairs do not match and these alternative quantities then, when variably applied, lead to a number of different calculated overall energy consumption figures. The fictitious standard value is then used to select the quantity-value pairs that appear most probable.</p>		

Over 170 country practices for national data collection

IEA training and capacity building overview in 2016

- Database on **how countries collect end-use data** – proving **very useful** concept, especially in our work with emerging and developing countries
- Requests to **expand** into methodological/design issues
- We still appreciated any **new examples** – eg. when new approaches are implemented

The screenshot shows the IEA website's search interface for the 'Energy Efficiency Indicators Statistics: Country Practices Database'. The page includes a navigation menu with 'STATISTICS' selected, a breadcrumb trail 'Home » Statistics » Topics » Energy efficiency » EE Indicators Manual', and a title 'Energy Efficiency Indicators Statistics: Country Practices Database'. Below the title is a descriptive paragraph and a search section with four columns of filters: 'Countries and territories', 'Sector', 'Methodology', and 'Available content'. Each filter column contains a list of items with checkboxes. At the bottom right, there are 'Reset' and 'Search' buttons.

Countries and territories	Sector	Methodology	Available content
<input type="checkbox"/> Albania	<input type="checkbox"/> Industry	<input type="checkbox"/> Administrative sources	<input type="checkbox"/> methodology
<input type="checkbox"/> Australia	<input type="checkbox"/> Residential	<input type="checkbox"/> Measuring	<input type="checkbox"/> project web site
<input type="checkbox"/> Austria	<input type="checkbox"/> Services	<input type="checkbox"/> Modelling	<input type="checkbox"/> questionnaire
<input type="checkbox"/> Belgium	<input type="checkbox"/> Transport	<input type="checkbox"/> Surveying	<input type="checkbox"/> report
<input type="checkbox"/> Bosnia and Herzegovina			<input type="checkbox"/> results
<input type="checkbox"/> Brazil			
<input type="checkbox"/> Bulgaria			
<input type="checkbox"/> Canada			
<input type="checkbox"/> China			

- Review of UNFCCC inventories
 - Qualitative and quantitative analyses of the discrepancies between CRF and data submitted to the IEA are provided by the IEA to the UNFCCC, for use in the official process of review of GHG inventories
- Contribution to IPCC Guidelines and broader cooperation with IPCC
 - IEA contributing author to 1996, 2006 Guidelines and 2019 Refinements for Energy
 - A joint IEA/IPCC workshop on energy data planned for 2017
- Collaboration with PBL/JRC (EDGAR database)
 - IEA provides energy and CO₂ emissions from fuel combustion historical data
 - PBL/JRC provides estimates of emissions from other GHGs and from other sectors

Publishing the Data – Another way to improve the quality of statistics

- Fundamental Principles of Official Statistics
 - Principle 1. official statistics that meet the test of practical utility are to be compiled and made available on an impartial basis by official statistical agencies to honour citizens' entitlement to public information. (73rd plenary meeting 29 January 2014)
- Communique of this G20 Ministers Meeting
 - We also acknowledge the importance of public disclosure of market related information on all energy resources.
- Raise visibility of statistics and message from stats (advertising)
- Inform Government, business, public, investors

- The dissemination policy should be user oriented, reaching and serving all user groups, including format, and provide quality information
- While recognizing the importance of statistical confidentiality, countries should implement those rules in a way to promote access to data while ensuring confidentiality
- Countries make their energy data available on a calendar period basis
- Countries announce in advance the precise dates when energy statistics will be released
- Release dates:
 - monthly data, within 2 calendar months
 - quarterly data within 3 calendar months after the end of the reference quarter;
 - annual data within 15 calendar months after the end of the reference year
- Countries are encouraged to harmonize their data with international standards
- It is recommended that countries disseminate their energy statistics internationally as soon as they become available to national users and without any additional restrictions.
- A glossary of terms should always accompany the disseminated tabulations of energy statistics.

- Books
- Databases (online and CDs)

- Internet

(most visited page of the IEA website)

- Booklet

(10 000 copies and over 100 000 downloads/year)

- Mobile App (available on all smartphones)

New format for Monthly Statistics

First IEA energy efficiency statistics release (Dec 2016)

STATISTICS

<http://www.iea.org/publications/freepublications/publication/energy-efficiency-indicators-highlights-2016.html>

Cross-sectoral overview

Largest end-uses by sector, 2014

Top-6 CO₂ emitting end-uses, 2014**

Final energy consumption by source

Drivers of final energy consumption***

Estimated energy savings from efficiency***

Estimated cumulative energy savings by sector, 2000-14***

*Other industries includes agriculture, mining and construction; passenger cars includes cars, sport utility vehicles and personal trucks; other end-uses includes the remaining part of emissions beyond the top-6; comb. renewables includes combustible renewables and wastes; other sources includes heat and other energy sources.

Residential sector

	Residential consumption (PJ)	Share of fossil fuels* in space heating (%)	Population (million)	Consumption per capita (GJ/pers)	Average dwelling surface (m ²)	Average dwelling occupancy (pers/dw)
2000	10 772	84	282	38	100	2.8
2014	11 792	70	319	37	181	2.8

Residential energy consumption by end-use

Residential energy consumption by end-use, 2014

Residential energy consumption by source

Appliances per dwelling, 2000-14 % change

Energy intensities by end-use per floor area

Energy intensities by end-use per dwelling

End-use indicators by sector for individual IEA countries – extensive consultation with data providers ahead of release

Time for discussion

- Maroc
- République Centrafricaine
- Cameroun

- What institutions are responsible for which data collection at your national level?
- What energy data are available and where are the gaps for your country?
- Are there agreements in place to share energy data?
- What barriers you find (technical, institutional, etc.) when collecting data?
- Do you have any good practice to share with others?
- Do you have requests to international organizations?

www.iea.org
